

## ePIPE<sup>®</sup> protects Gorgeous waterfront home on Newport Harbor

### The Problem:

After several leaks this retired homeowner had enough. He spent his career in the California court system and was use to making decisions based on the facts. The copper piping was failing and he new it was only a mater of time when the next pinhole was going to occur. The size and design of this large home made re-piping virtually impossible. The estimates that were given by plumbing contractors were out in left field. The reconstruction of the fine finishes would have been two to three times the cost of the re-piping alone. A friend who had the ePIPE<sup>®</sup> system installed in his home and raved about how clean and professional the people at ePIPE were recommended he solve his problem with this new technology. Upon his friend's recommendation and the information given to him from the ePIPE consumer advisor he decided that the ePIPE<sup>®</sup> system was the right choice.

### The Solution:

The ePIPE<sup>®</sup> System of in-place pipe restoration. After only three days his entire home was completed. With the ePIPE<sup>®</sup> system he avoided the destruction normally associated with re-piping. The process uses the latest in technology to internally sand blast the existing pipe. Once the piping is cleaned and clear of debris an epoxy lining is installed inside the existing pipe. All this is done without the use of chemicals and there is no mess or reconstruction. In a day and half the home was completed and the water ran clear and clean with all the flow it once had years ago.
