

This beautiful Santa Clarita Valley home was plagued with aggressive water

Santa Clarita valley is home of the world famous Magic Mountain amusement park. It also is well know locally for having some of the most aggressive water in the country. Recently a 42 million dollar lawsuit was settled on the behalf of many residents for their failing galvanized water piping.

The Problem:

Brown rusty water and pinhole leaks from failing galvanized water piping. This home was about 20 years old and the homeowner had experience several pinhole leaks. They could not imagine having to tear up their beautiful home with a repipe after seeing what horrors their neighbors and friends went through that chose to repipe. The other haunting concern was the knowledge that those homeowners in the area that had chosen copper repiping were facing pinhole leaks in just a matter of a few years due to the aggressive water in Santa Clarita.

When several friends had told them about ePIPE this family knew they had found the answer to their problems. They were not going to have to face the nightmare and mess of a repipe. Their friends had been so impressed with the entire experience they had with ePIPE teams working on their homes they gave glowing recommendations.

The Solution:

The ePIPE[®] System of in place pipe restoration. The ePIPE process uses a patented technology to internally clean the inside of existing water piping system. Once the piping is dried, cleaned and cleared of debris, the company installs a patented epoxy lining inside the existing piping system. The whole process is completed without the use of chemicals and the need to tear up walls to get to the existing water piping system. In a less than two days the restoration of the entire water piping system was completed! The result, better than new piping, water flow was restored and the water ran clear and clean.
